Key Findings and Recommendations

Findings (all from charts):

1. Appointments with no reminder had a 30.2% no-show rate, about 2.6 times the 11.4% for patients who got SMS, WhatsApp and a call.
2. Home Visits (26.2%) and Video Consults (21.1%) have far higher no-show rates than In-Clinic visits (12.2%), a gap of 14 points for Home Visits.
3. Bookings made 15-30 days ahead have a 20.0% no-show rate, versus 14.3% for bookings made 1-3 days ahead.
4. Saturday and Sunday both have an 18.7% no-show rate, compared with 13.7% to 15.6% on weekdays.
5. Walk-In has the highest rate by booking channel at 20.9%, 6.7 points above the Apollo App at 14.2%.

Notes and limits:

1. Rates exclude appointments still scheduled (2,348), because their outcome isn't known yet.
2. These are patterns in the data, not proof of cause.
3. Walk-In having the highest no-show rate looks unusual, since walk-in patients are already present. I'd check how those records are logged before relying on that result.

Recommendations :

1. Make sure every appointment gets at least one reminder. About 11,000 appointments (excluding ones still scheduled) . If their no-show rate matched the full-reminder group, that would be roughly 2,000 fewer no-shows. This is an upper-bound estimate, since reminders may not explain the whole gap.
2. Add a confirmation step for Home Visits and Video Consults, where no-shows are highest.
3. Re-confirm bookings made more than a week ahead, and look at weekend slots separately.
